## SUBSTRATE INFORMATION

### COROPLAST

Coroplast is a semi rigid substrate that looks like corrugated plastic, hence it's name. Suitable for indoor and short term outdoor uses, it is fairly durable, but may not withstand heavy weather and can become brittle over years of UV exposure.

### KOMOBRITE

Komobrite is a semi-rigid, flexible solid plastic substrate that has smooth surfaces. Suitable for indoor and short-term outdoor uses, it is fairly durable, but may not withstand heavy weather and can become brittle over years of UV exposure. It is best suited for smaller signs or larger sign mounted to a solid surface.

### ALUPANEL

This rigid, lightweight and durable substrate is our favorite for signs. It is double-sided with a smooth aluminum-surface sheet held together with a lightweight core. Alupanel can be CNC router-cut to create amazing eye-catching signs.

### ALUMINUM

For the most durable signs, choose our solid aluminum sheets. .08" thick sheets come in affordable pre-cut sizes, and are perfect for signs that may be prone to extreme conditions. Aluminum can also be CNC router-cut.

### PLEXIGLASS

For that extra something, add a dimensional element to your sign by using one, or multiple layers of Plexiglass. Colourless clear or white sheets are available in a wide range of shapes and sizes. Plexiglass can also be CNC router-cut.
